[Mainstream 2027](#) | [Extended 2030](#)

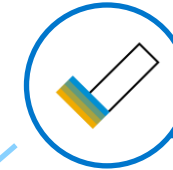

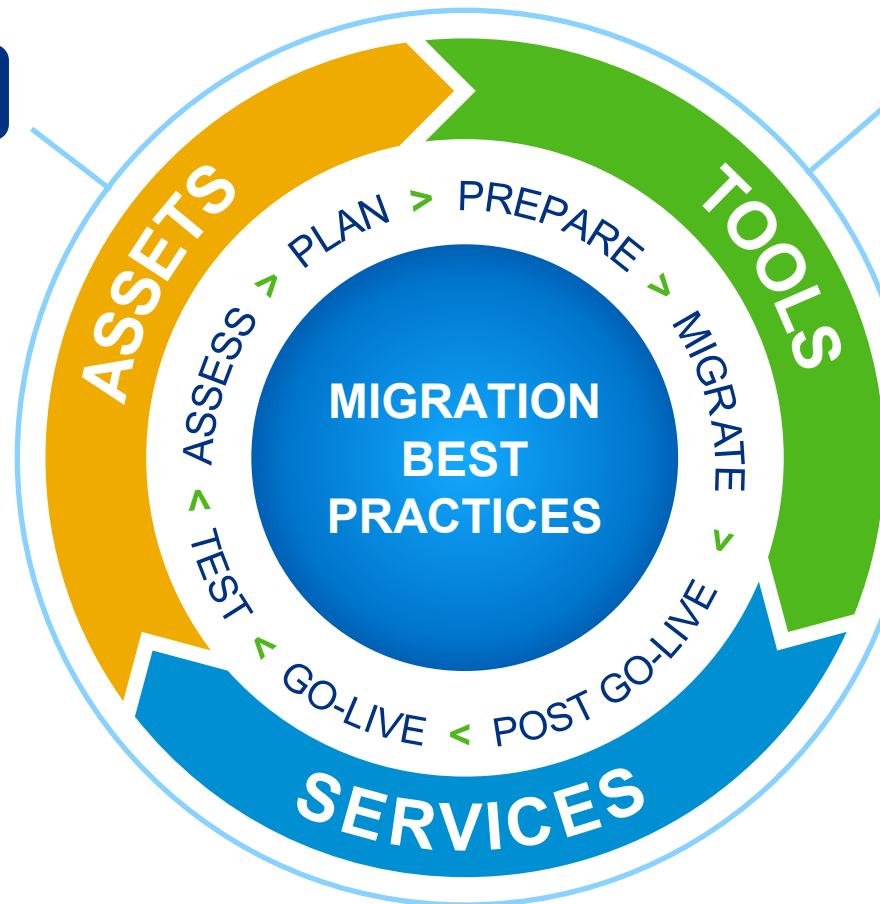

Choose the best way to modernize integration faster and with less risk

Consume assets, tools, and services from SAP & partners

QUICK START

- The **SAP Migration Factory** is a **free** 2-3 week program to help you assess and plan your migration from **SAP PI/PO** to **SAP Integration Suite**
- The **Evolve Neo** program is **free**, and gives you access to SAP experts to help plan and prepare your migration to SAP Integration Suite on SAP BTP, **Cloud Foundry** environment
- **SAP Consulting Quick Start Services** offer SAP Integration Suite quick start and migration assistance in a **short duration** and **low cost model**

SELF-SERVICE

- **Assessment tools** to evaluate your existing environment and estimate efforts
- **Tools to automate migration and testing** from SAP and partners
- **Migration guides, documentation, and community content** to guide you through the migration lifecycle
- **Pre-built integrations** maintained by SAP

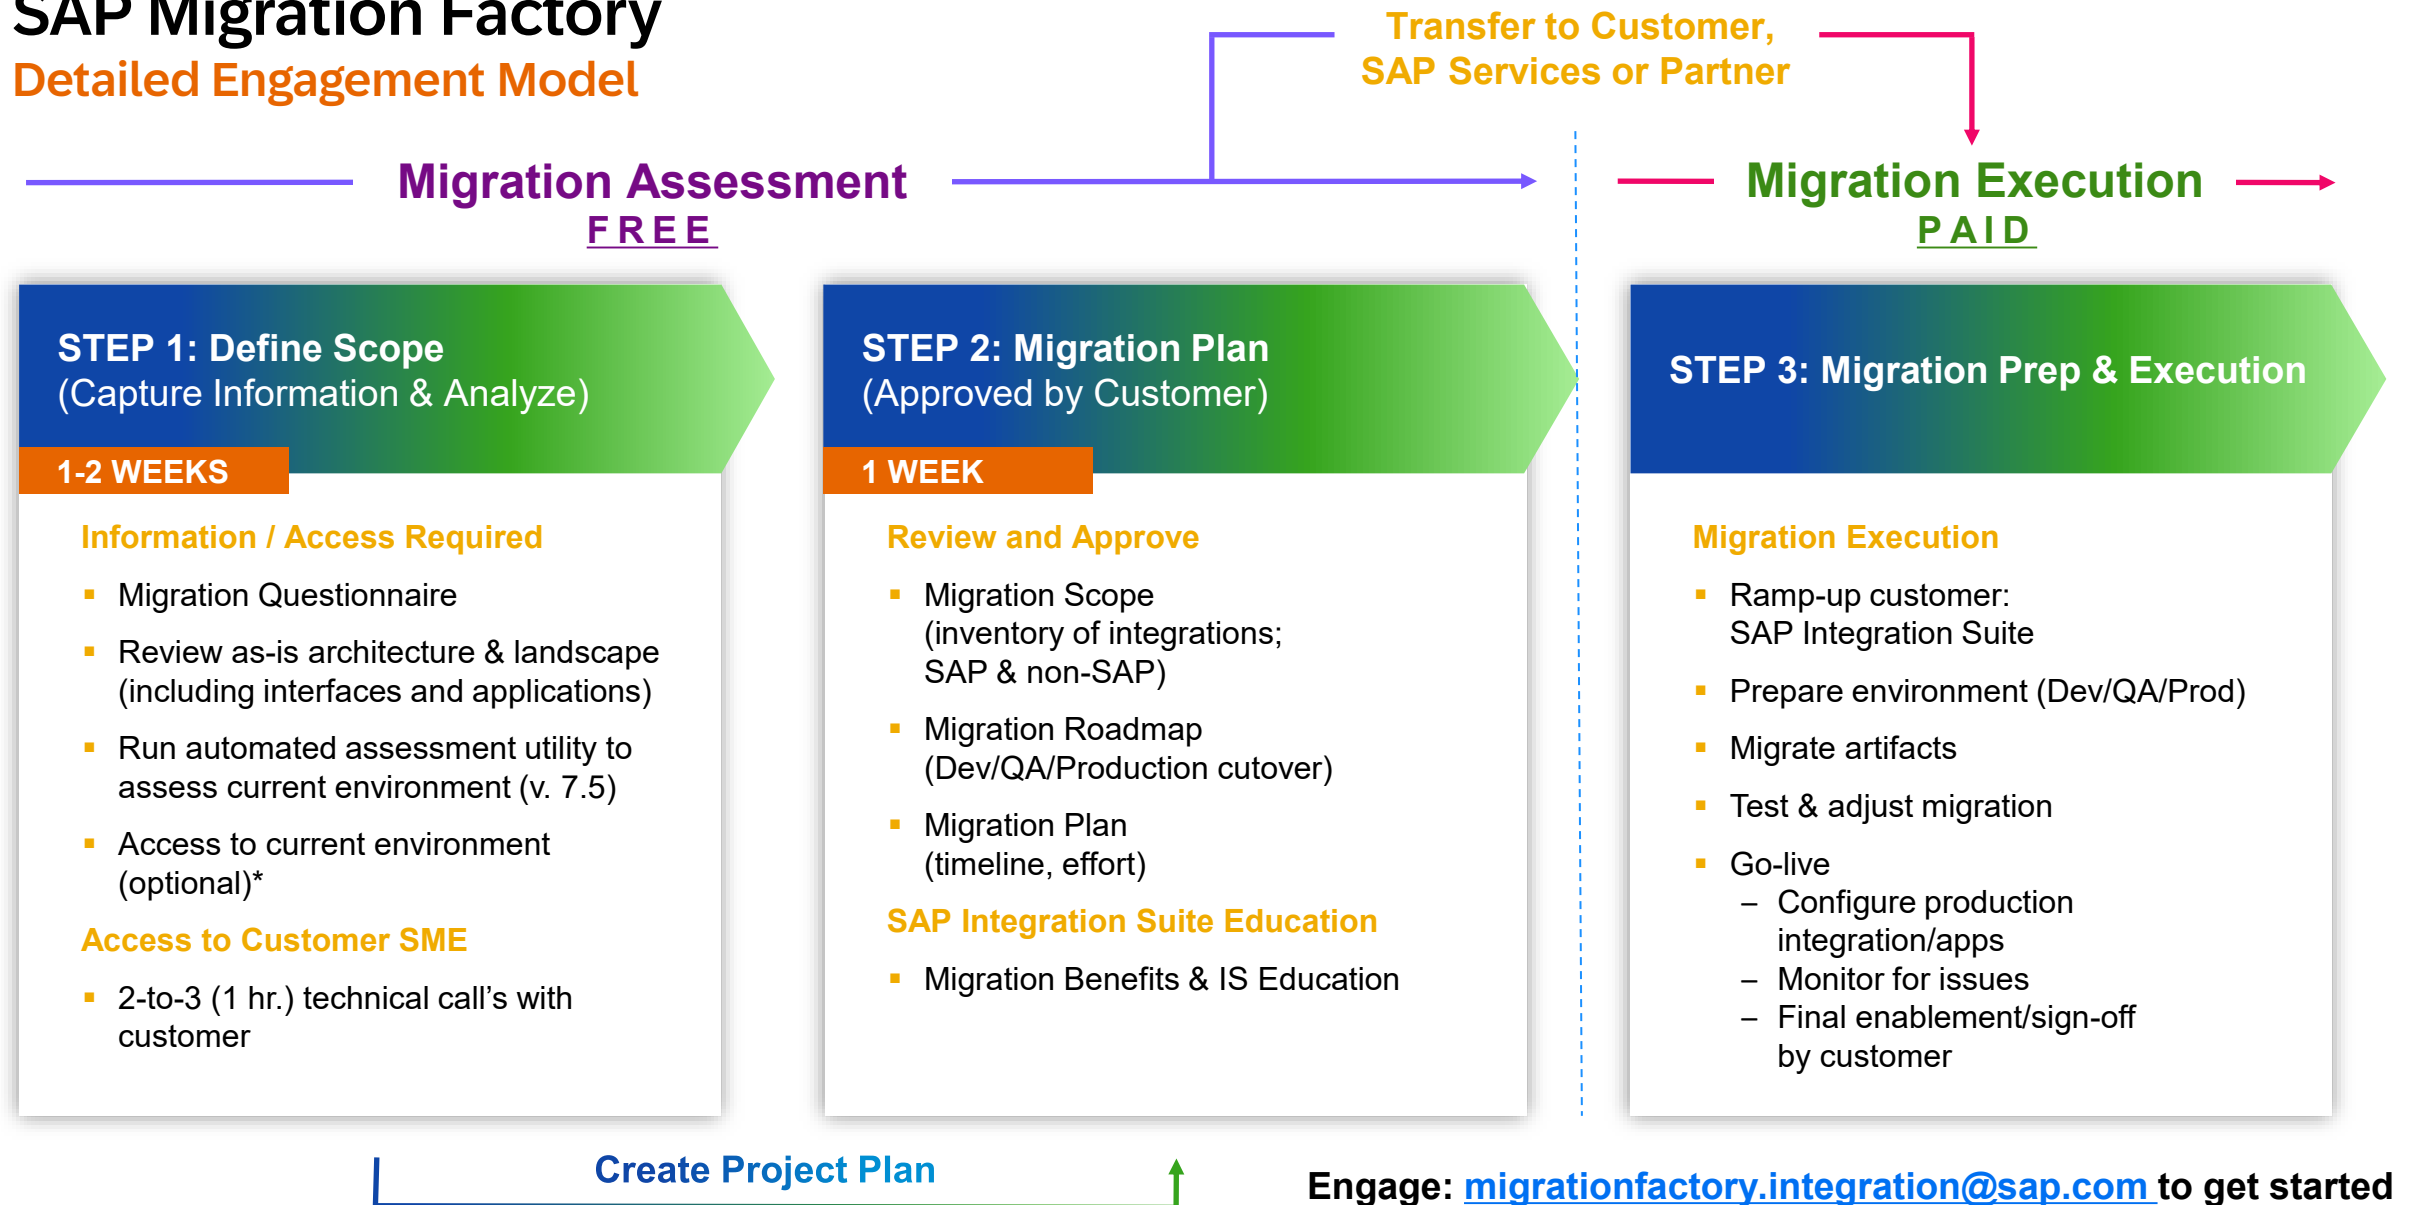

END-TO-END

- **SAP Services** offers tailored services across the entire migration lifecycle – including **implementation services**
- **SAP MaxAttention** offers a customizable deep dive **SAP PI/PO migration workshop** along with **proof-of-concept, health-check** and **on-call go-live** support services.

SAP Migration Factory

Detailed Engagement Model

Migrating **Neo CPI** integration services to **SAP CF multi-cloud** **environment**

Farewell, Neo!

Neo Environment

SAP BTP, Neo environment will be sunset on December 31, 2028:

- Services and environment will remain available for use until December 31, 2028 (subject to terms of contracts).
- To minimize the impact, we are providing migration guidance and accelerator tools to lower migration costs and the commercial impact.

Multi-cloud environment

The multi-cloud foundation for SAP BTP remains the strategic direction:

- New features and innovations will be focused on the multi-cloud foundation.
- You can benefit from SAP BTP services running on the infrastructures of some of the market-leading cloud infrastructure providers in a growing set of data centers across the globe.

Neo Sunset program: Free migration assessment for SAP BTP customers

Setting you on the right path to migrate your Neo implementation to a modern, multi-cloud foundation

Four easy steps to help you succeed in your modernization journey

1

One-hour kick off call to go over an overview of the program and migration process

2

An SAP BTP expert for two weeks:

1. Analyses your Neo services – including your apps, configurations, and security settings
2. Develops a migration roadmap detailing system scope and migration journey

3

One-hour call to review the migration roadmap and discuss next steps with your team

4

Checkpoint Calls every 2 – 4 weeks with SAP BTP experts to address your migration-related questions

Prerequisites

- Program open to CPEA and subscription customers only
- Must have active SAP BTP, Neo environment subaccounts
- Must grant SAP access to subaccounts to be analysed for migration

Get started today!

Contact: sap.btp.migration@sap.com

Benefits of SAP Integration Suite compared to the standalone capabilities

Future-proof your investments and move to multi-cloud deployments

Unified commercial model and harmonized metering

- Simplified consumption based on common metric ([messages](#))
- Unlimited SAP-to-SAP application integration with proven prebuilt integrations delivered and updated by SAP
- Trading Partner Management, Integration Advisor and B2B libraries
- Graph as part of API Management and OData Provisioning
- Data Space Integration (restricted)
- Event Mesh capability

Features and functions

- Generative AI features (e.g. generation of integration flows, API anomaly detection, script optimization)*
- Unified user experience with simplified navigation between integration services
- Integration Assessment based on ISA-M methodology
- Optional hybrid runtime Edge Integration Cell, compatible for Cloud Integration content
- Dropbox, Slack, Splunk, MS Azure, MS 365 SharePoint, RabbitMQ, MDI, ServiceNow, Workday, Snowflake, NetSuite ERP, Coupa, Amazon DynamoDB, SMB, and Jira adapters
- Consuming adapters from SAP Business Accelerator Hub
- Message mappings and Groovy scripts as reusable artifacts across integration packages
- [Almost unlimited storage](#) of message processing log attachments
- Centrally onboard and manage trading partners for B2B/EDI exchange
- B2B monitoring and archiving of B2B interchanges
- Inspect the resource utilization and identification integration flows as top consumers
- Migration tooling to transition from SAP Process Orchestration including import of value mappings

Improved SLAs and operations

- Availability on hyperscale environments
- [No downtime for maintenance activities](#)
- Quarterly maintenance windows for major upgrades only 4 hours
- [99.95% SLA](#)
- Improved high availability via default support for multi-availability zones
- Analysis of metered messages

Roadmap

- Continuous publication of prebuilt integrations from SAP LOBs, partners, and community
- Use case parity compared with SAP Process Orchestration
- Improved developer productivity with generative AI
- Automatic scaling

SAP Integration Suite

Deployment Options

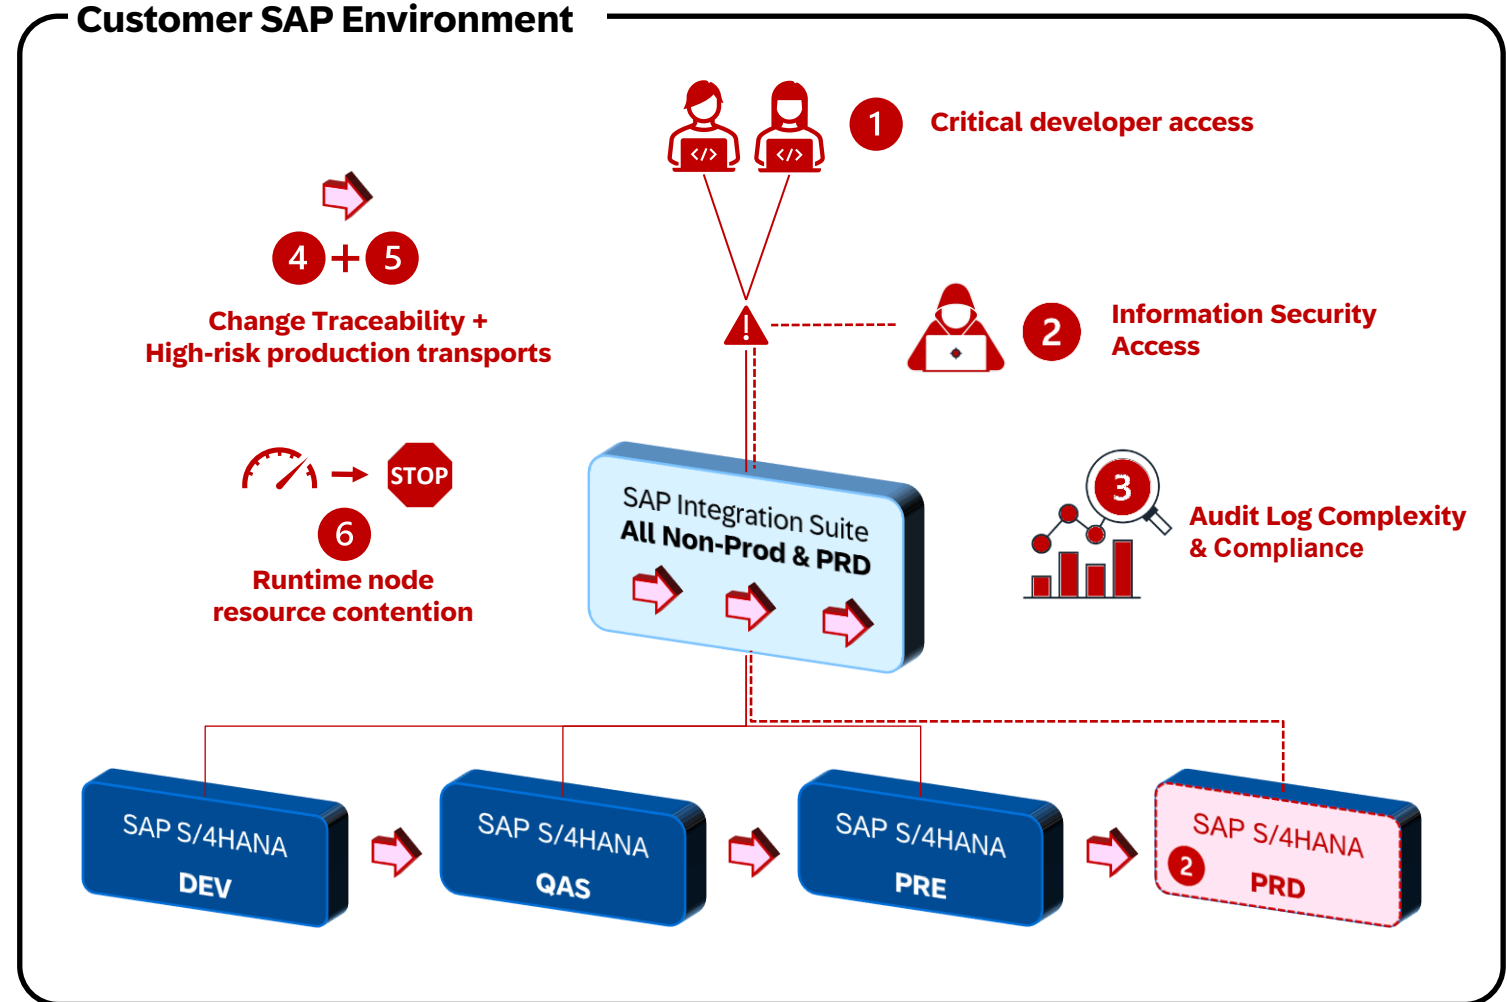

Though not
widespread, some of
our customers have a
**single tenant
integration deployment
topology**

Enterprise Integration | What's the problem with only having 1 tenant?

Example: Four SAP S/4HANA tenants <> **Single Tenant** of SAP Integration Suite

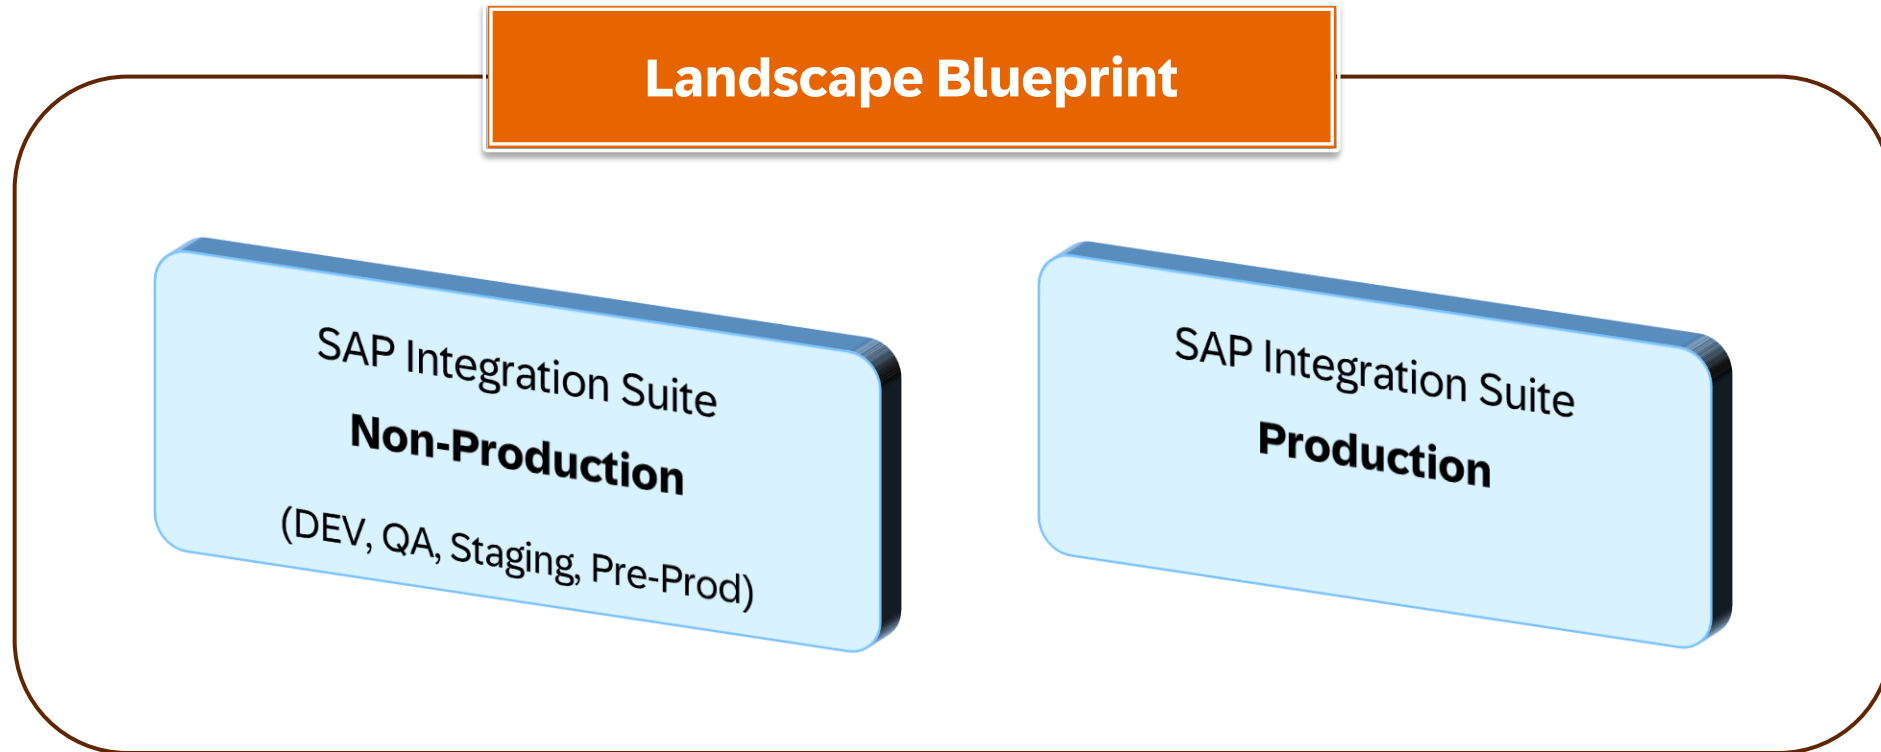

- 1 Critical developer access:** Developers have unrestricted access to the single shared environment, potentially enabling unintentional changes across all workloads – including PRODUCTION
- Information Security Access Risks:** Any user can reach production content in the same tenant, creating significant data exposure, IP risks,
- 3 Audit Log Complexity & Compliance:** No separation of access logs across environments triggers regulatory scrutiny during audits.
- 4 Limited change traceability:** Changes across mock environments become difficult to trace, rendering identification of unauthorized modifications very problematic.
- 5 Error-prone production transport:** No formal transport exists; all production modifications happen manually.
- 6 Runtime resource contention:** Dev processing with heavy Groovy scripts, XSLT, or Java libraries competes directly with production workloads

What has been the
recommended
architecture deployment
for most of our
customers ?

Typical 2-tier tenant landscape deployment

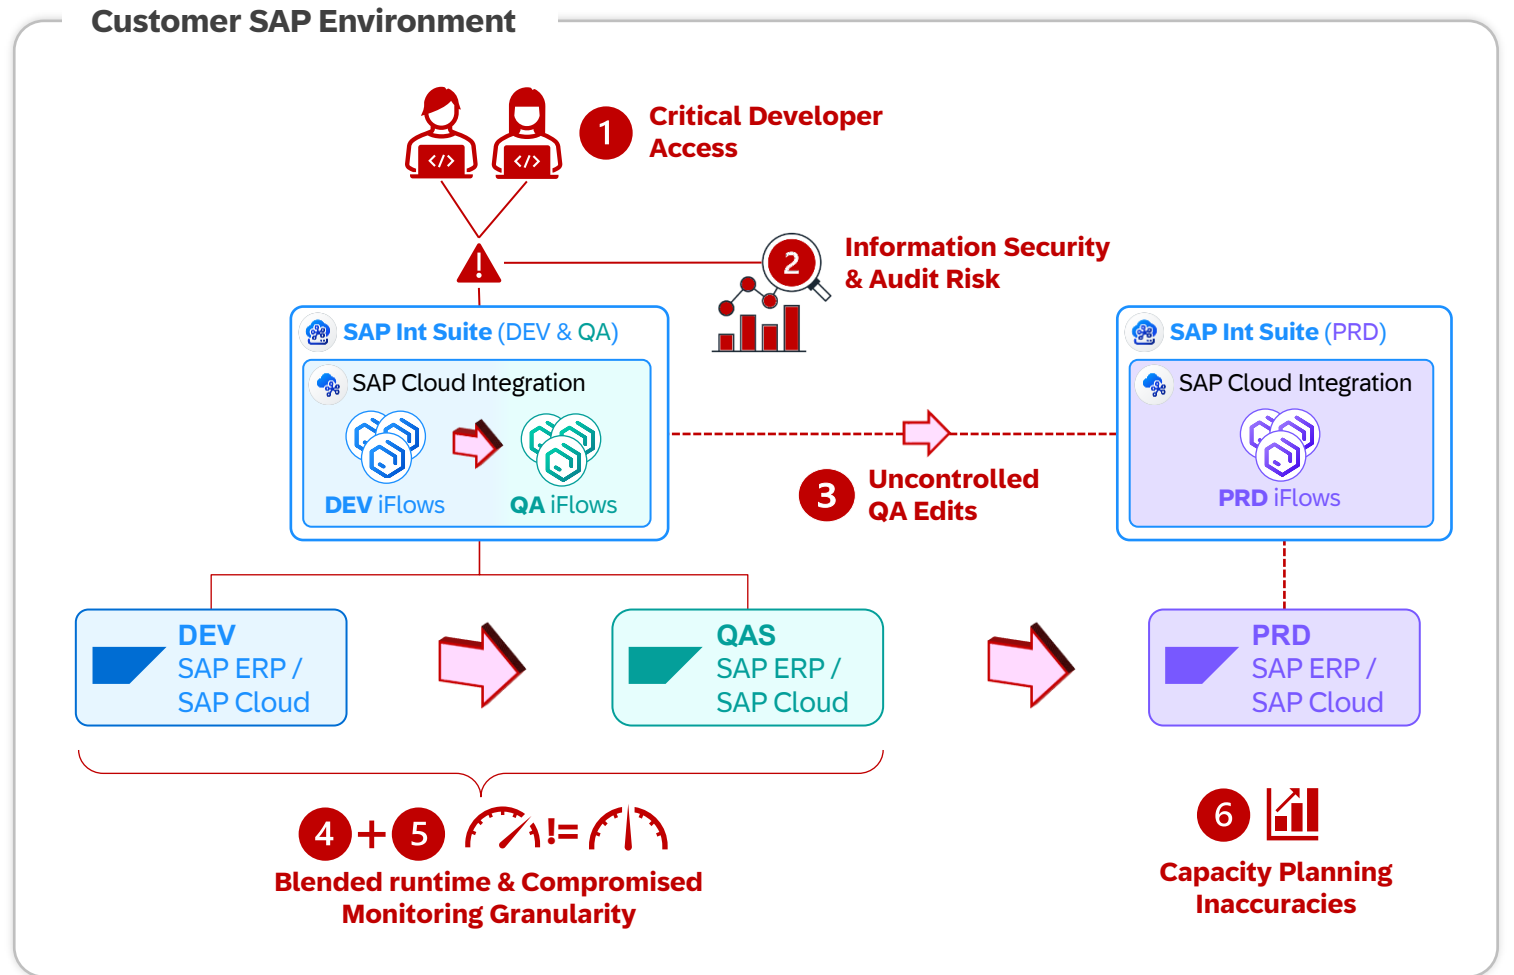

This deployment architecture has worked well until now – but with **increase in integration artifacts**, **multiple configuration settings**, and **different functional & non-functional teams** delivering on integration requirements – customer are likely to encounter fresh challenges

Enterprise Integration | What's the problem with only having 2 tenants?

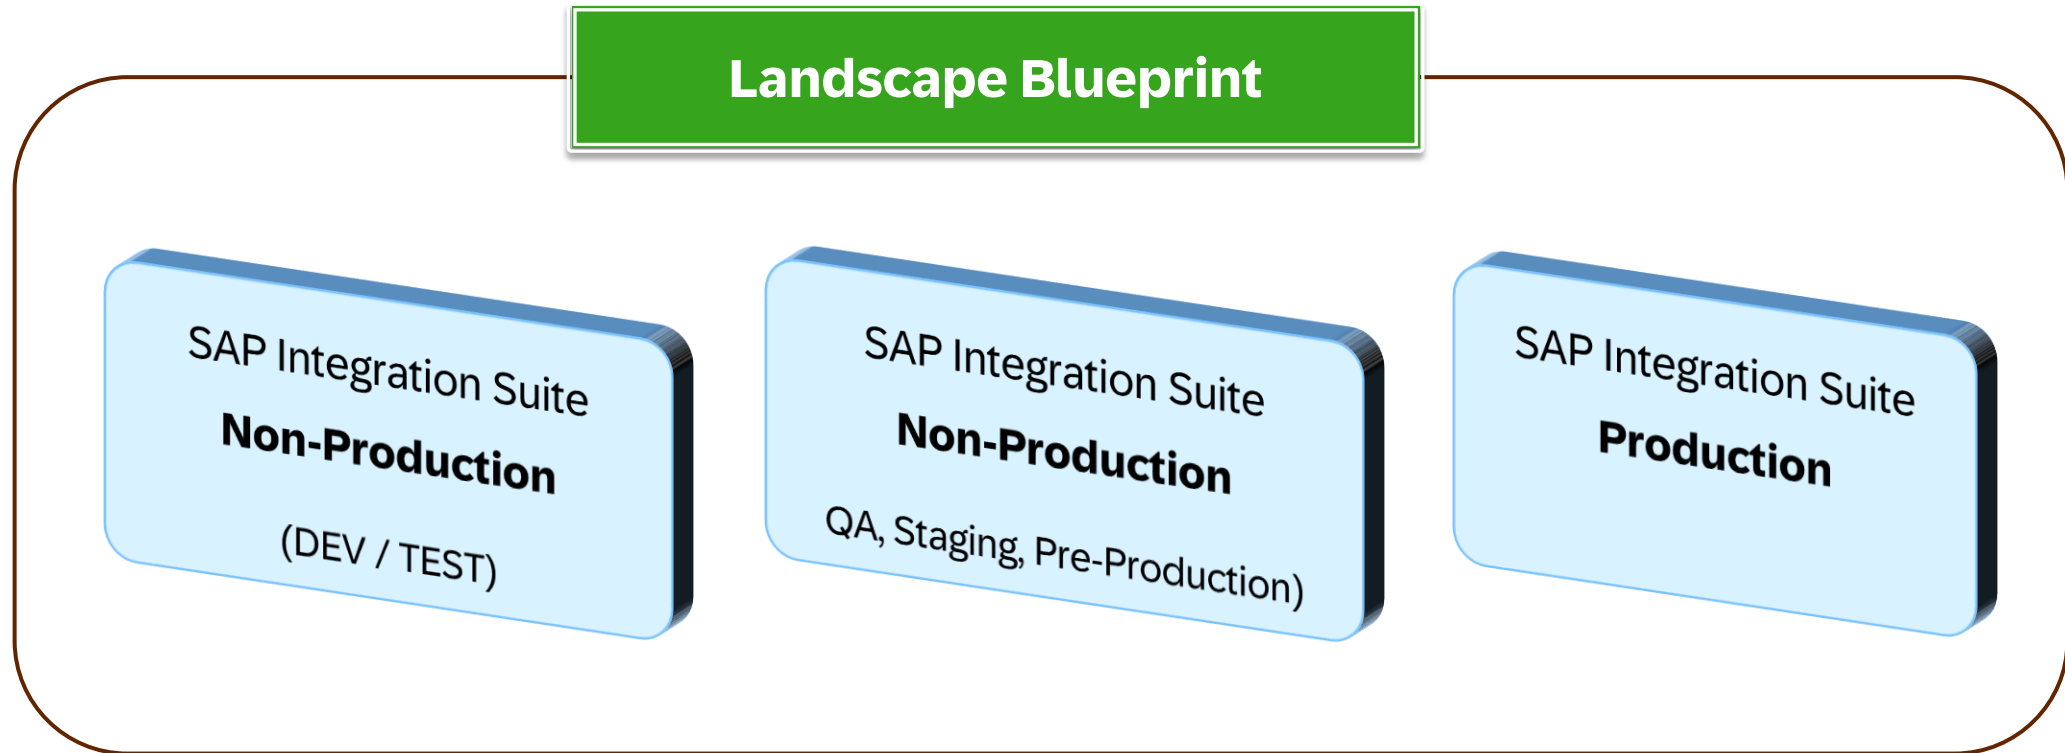

Example: Four SAP S/4HANA tenants <> **Dual Tenants** of SAP Integration Suite

- 1 Critical developer access:** Developers with access to the non-production tenant can accidentally corrupt QA testing environments.
- 2 Information Security & Auditing Risks:** Dev/QA tenant consolidation violates SoD, leading to manipulated test results
- 3 Uncontrolled QA edits:** QA testing integrity is undermined by parallel development activity with no system-enforced boundaries.
- 4 Blended runtime:** Development activities create unpredictable resource contention during critical test cycles.
- 5 Compromised monitoring granularity:** Problematic identification of isolated QA-specific issues from development noise
- 6 Capacity planning inaccuracies:** Inaccurate QA performance baselines, leading to incorrect production capacity estimates.

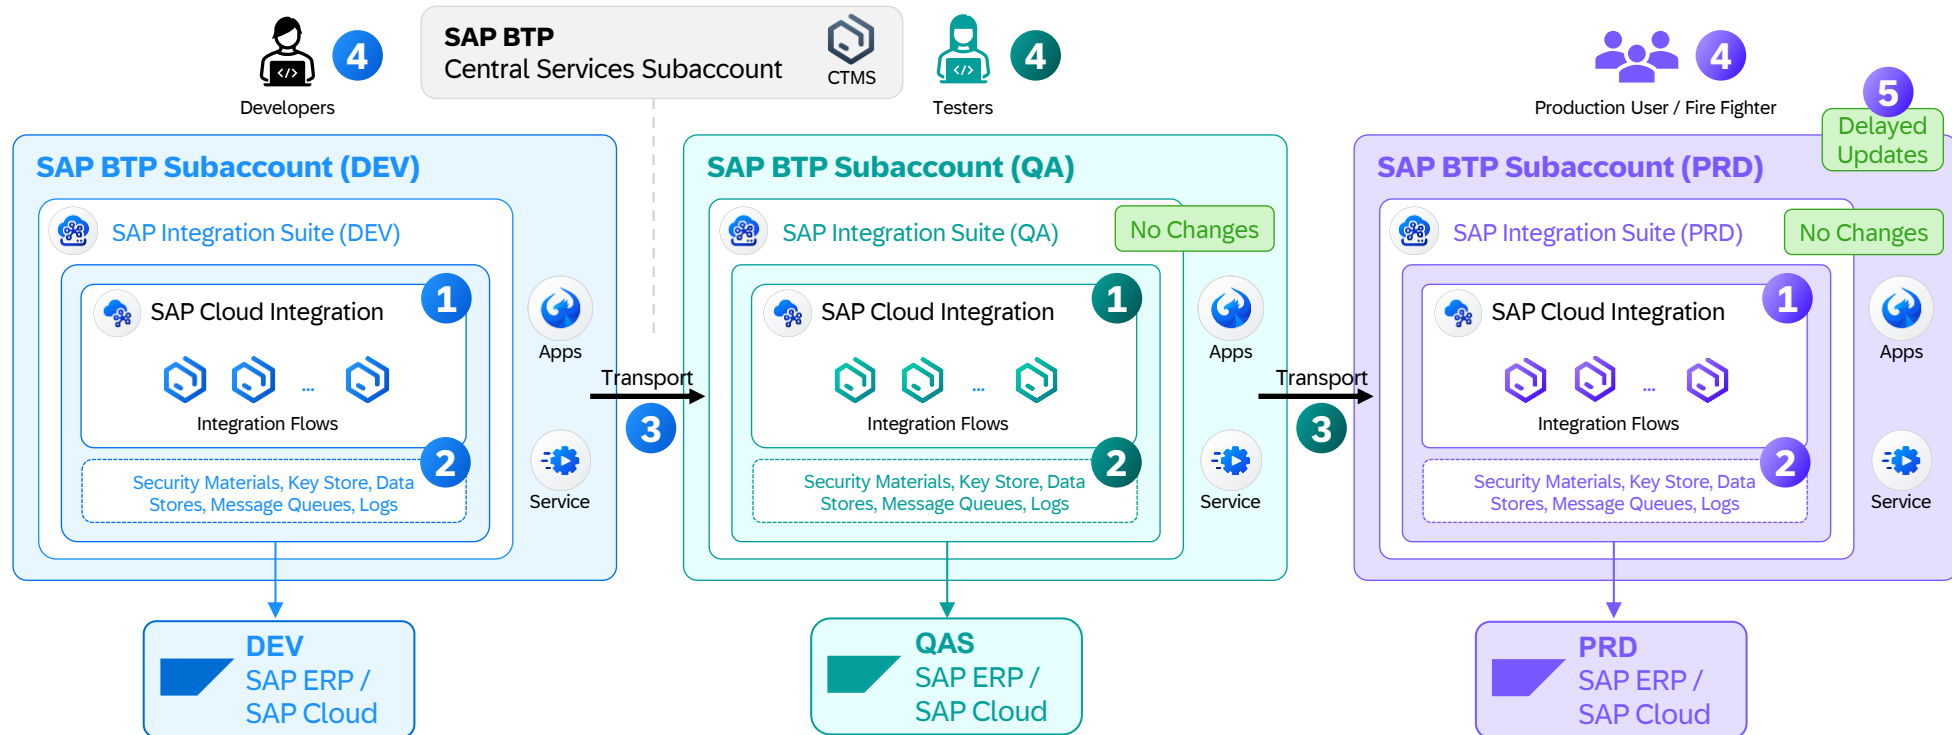

What **architecture deployment**
should we now **recommend** for our
existing customer base ?

Recommended 3-tier tenant landscape deployment

SAP Recommended Architecture

The Enterprise-Grade integration approach: 3-Tenant Landscape

- ① No manual copies required
- ② Tenant-wide artifacts, logs and connection points physically segregated
- ③ Proper DevOps pipeline implementation
- ④ Access physically segregated for Dev, QA and Prod/firefighter users
- ⑤ Mitigate issues early with delayed software update for Production

- ✓ Complete segregation of duties
- ✓ Formal transport and version control
- ✓ Isolated runtime resources
- ✓ Clean audit trails
- ✓ Accurate performance testing
- ✓ Protected production environment

What **objections**
will our **customers**
likely raise ?

Customers are unlikely to spend on

NON-PRODUCTION ENVIRONMENTS

as they see it to be
of less critical

while more emphasis is put on the

PRODUCTION ENVIRONMENT

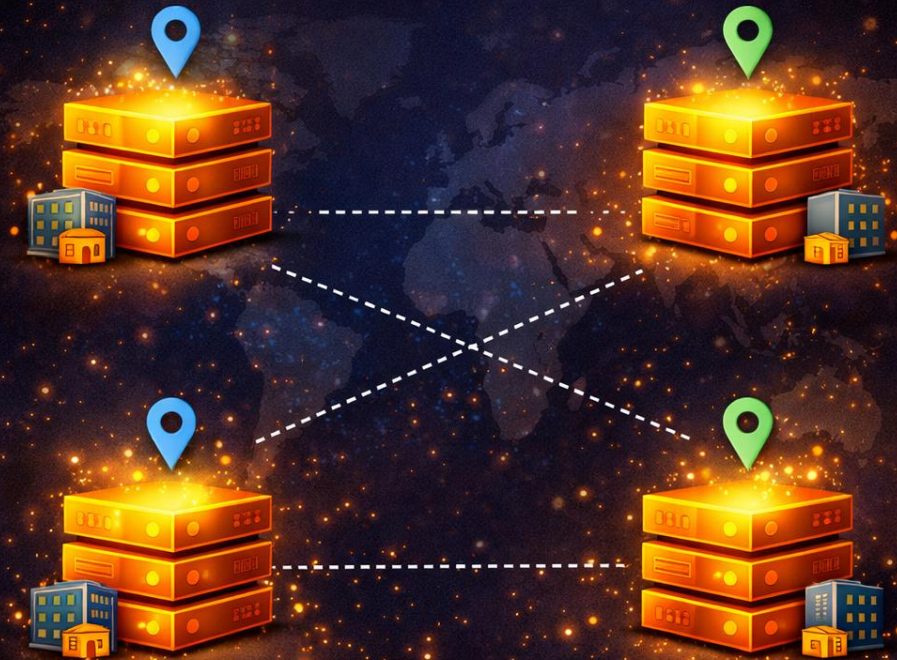

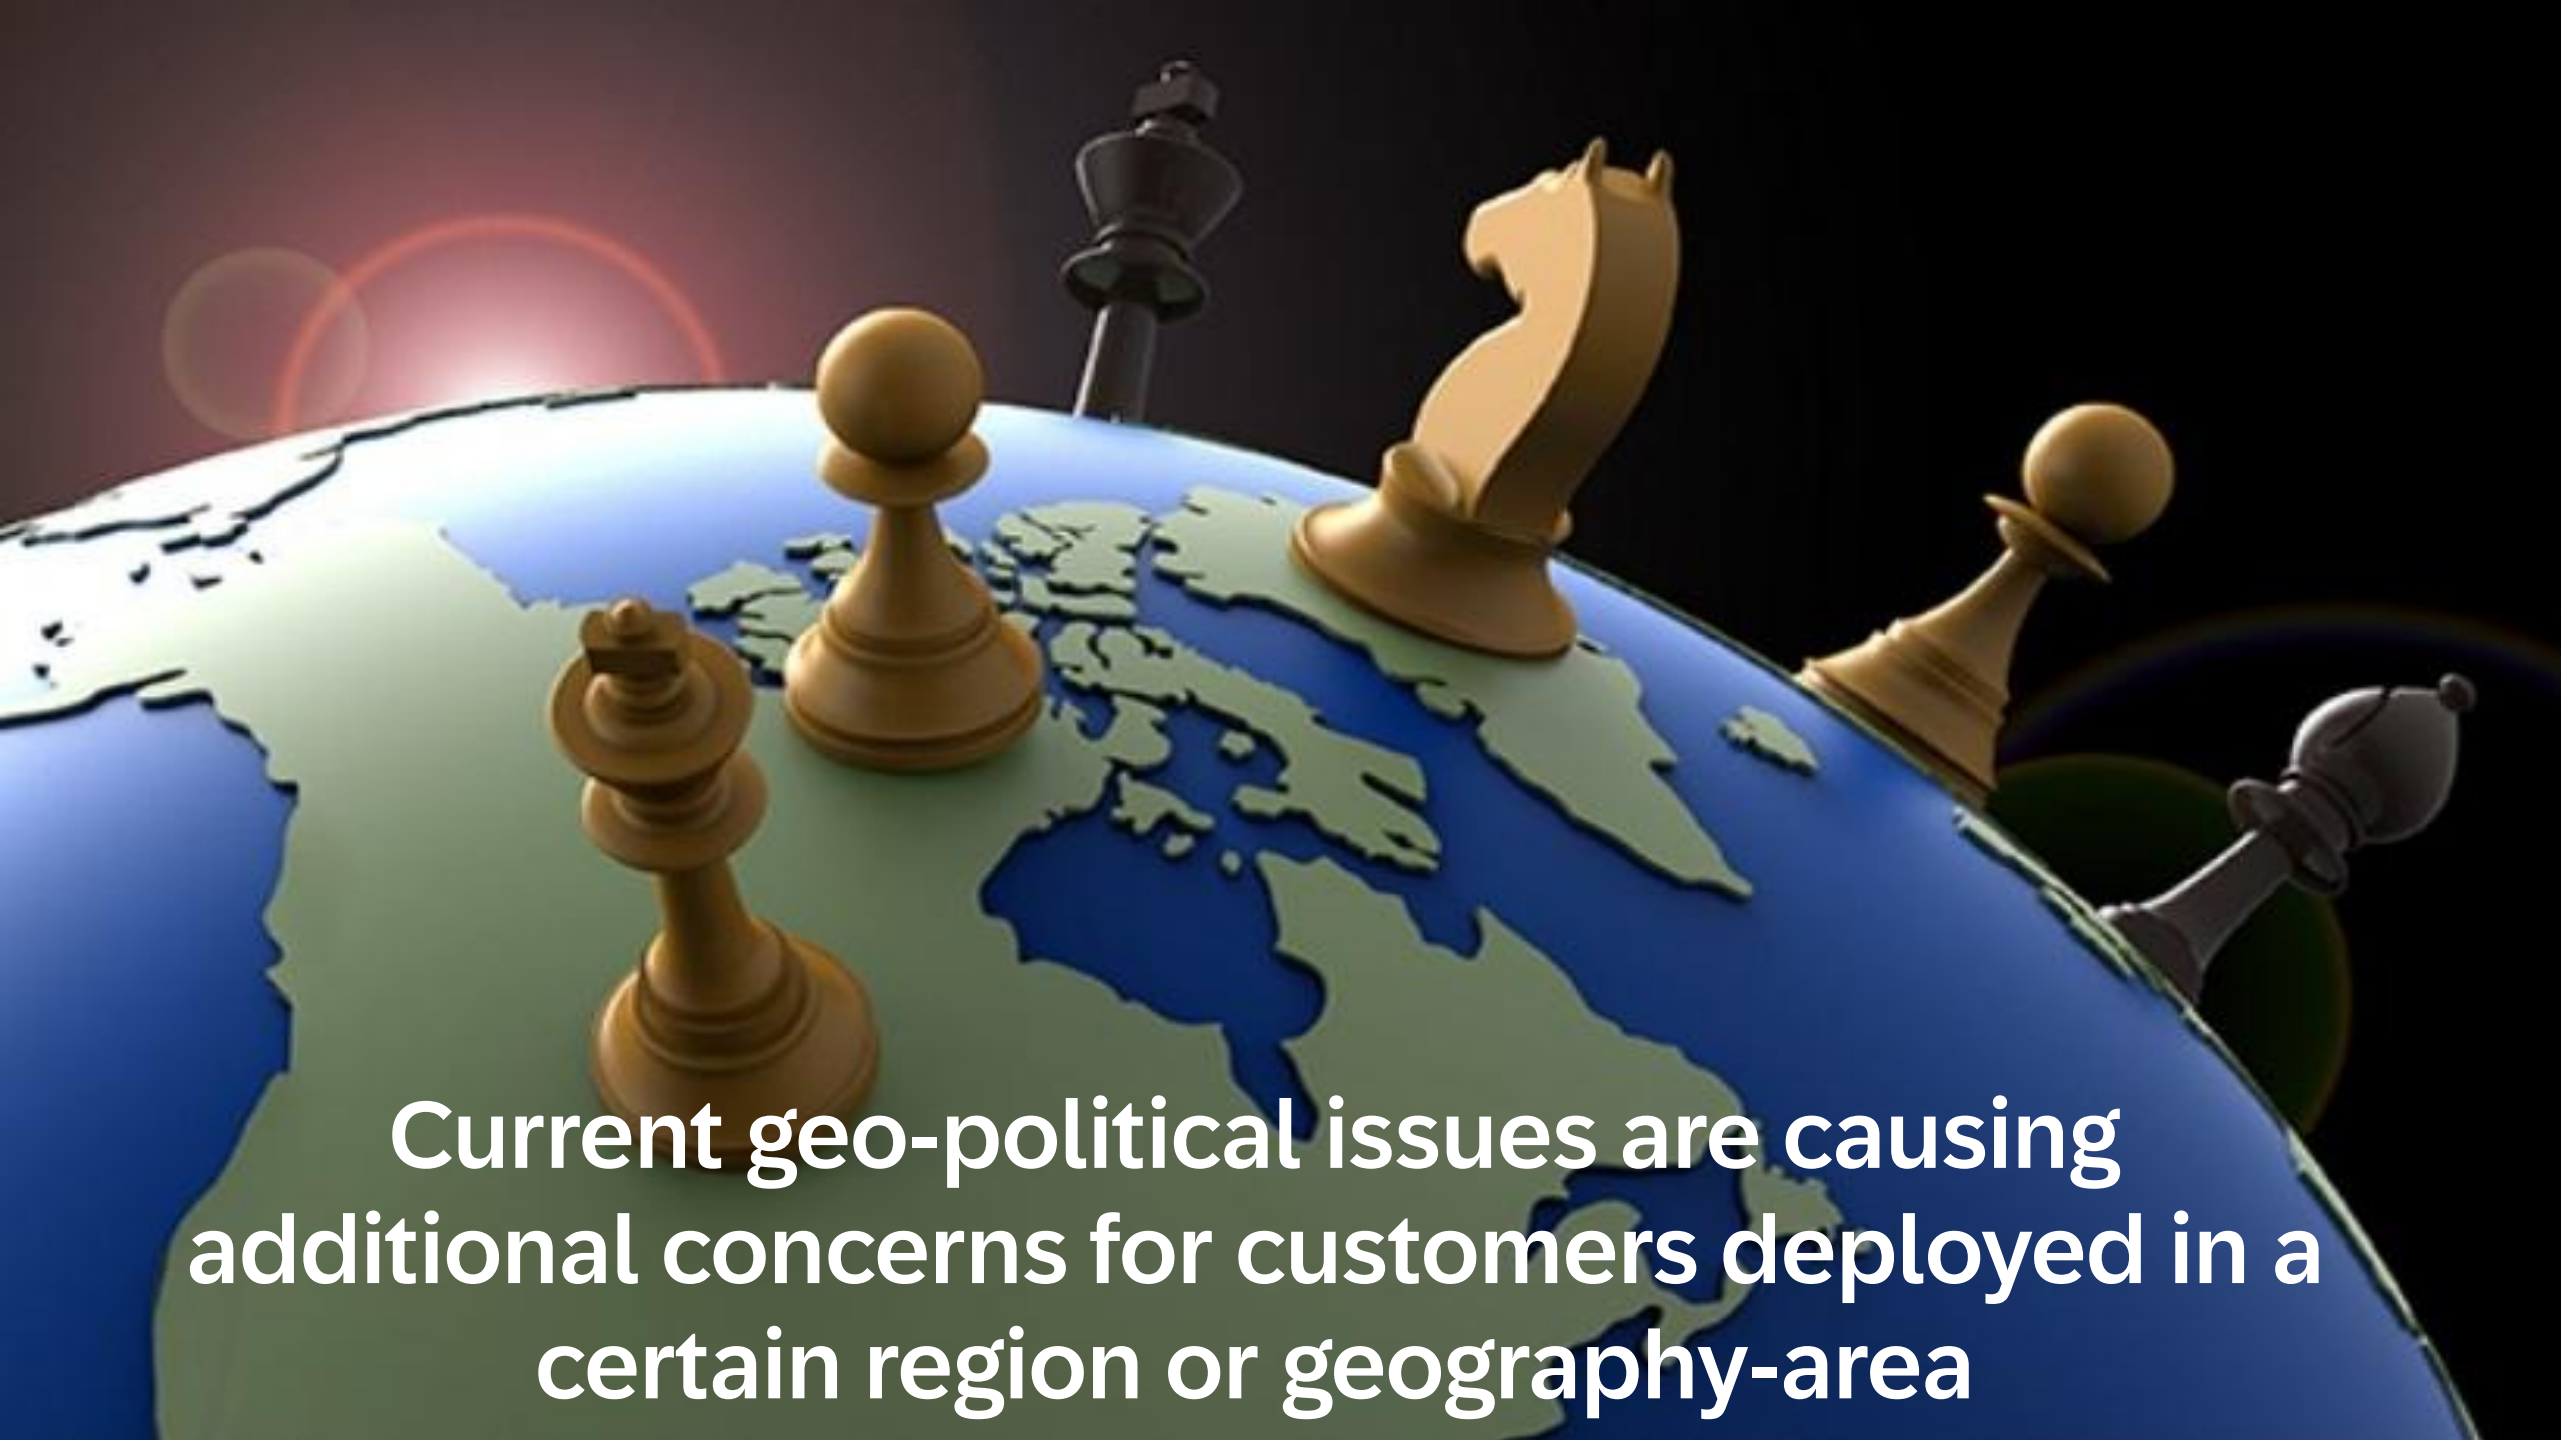

**What are the alternate strategies for a
3-tier tenant architecture ?**

**Production is still a
Single-tenant topology–
and thus a . . .**

Single point-of-failure

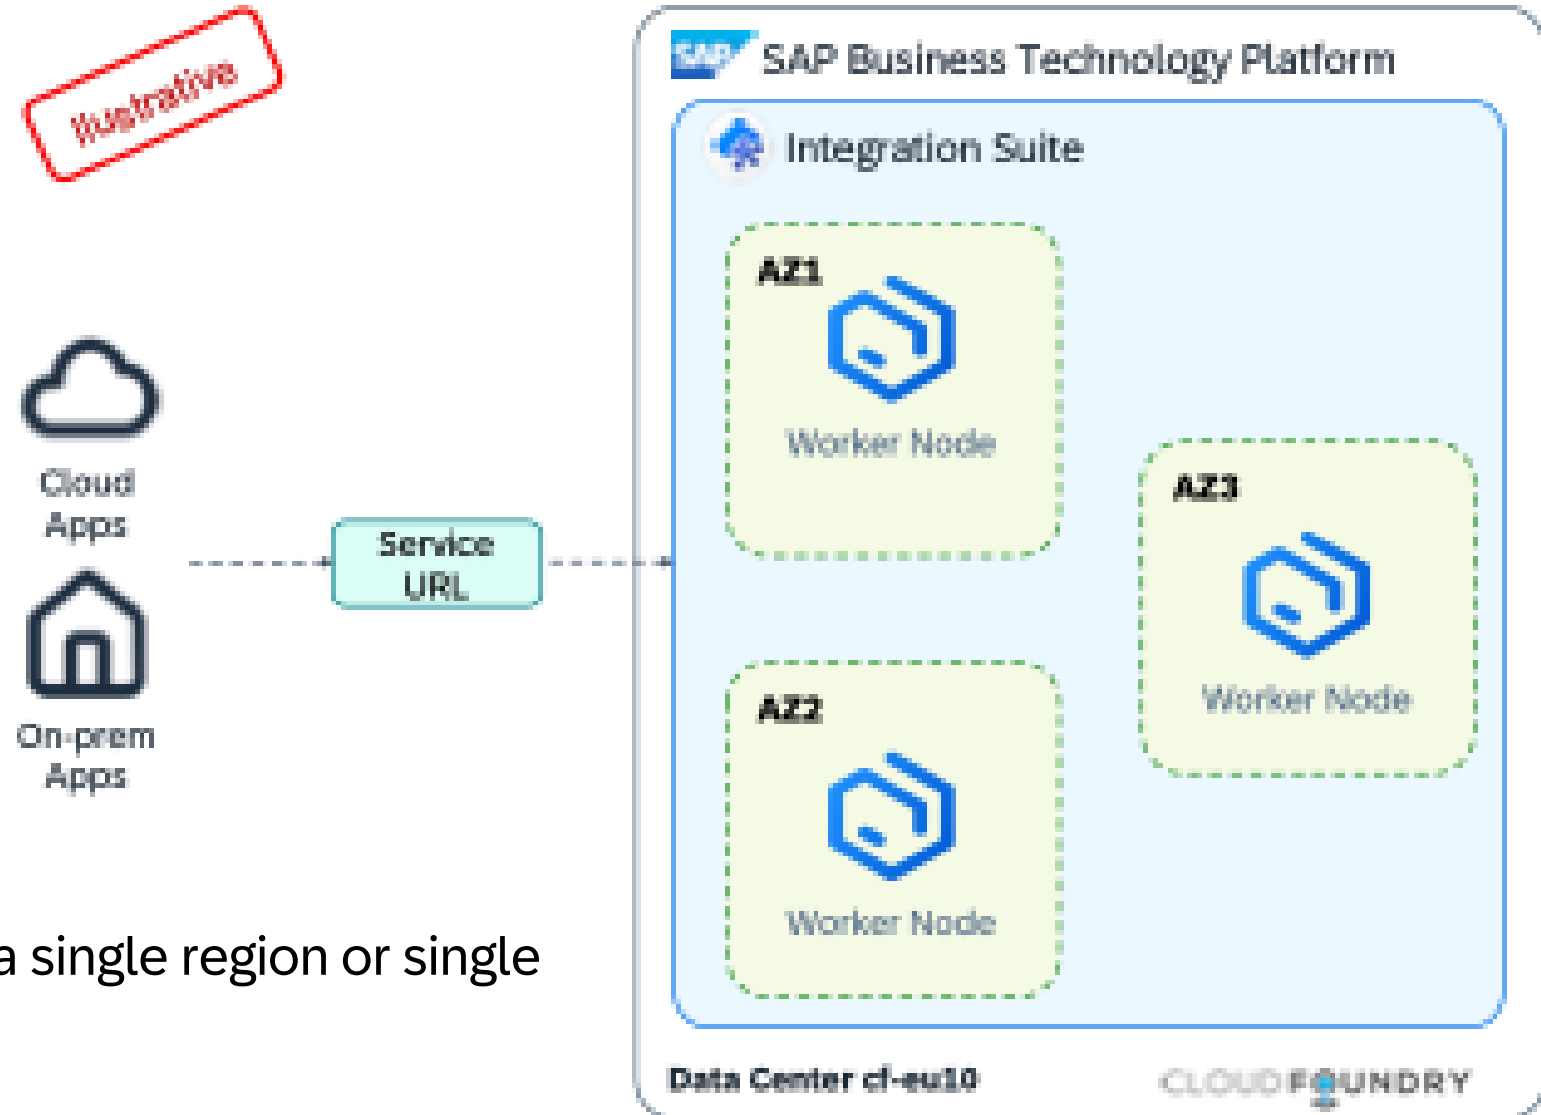

Look at providing a resilient
Production environment
with a
Multi-Tenant / Multi-Region
tenant architecture

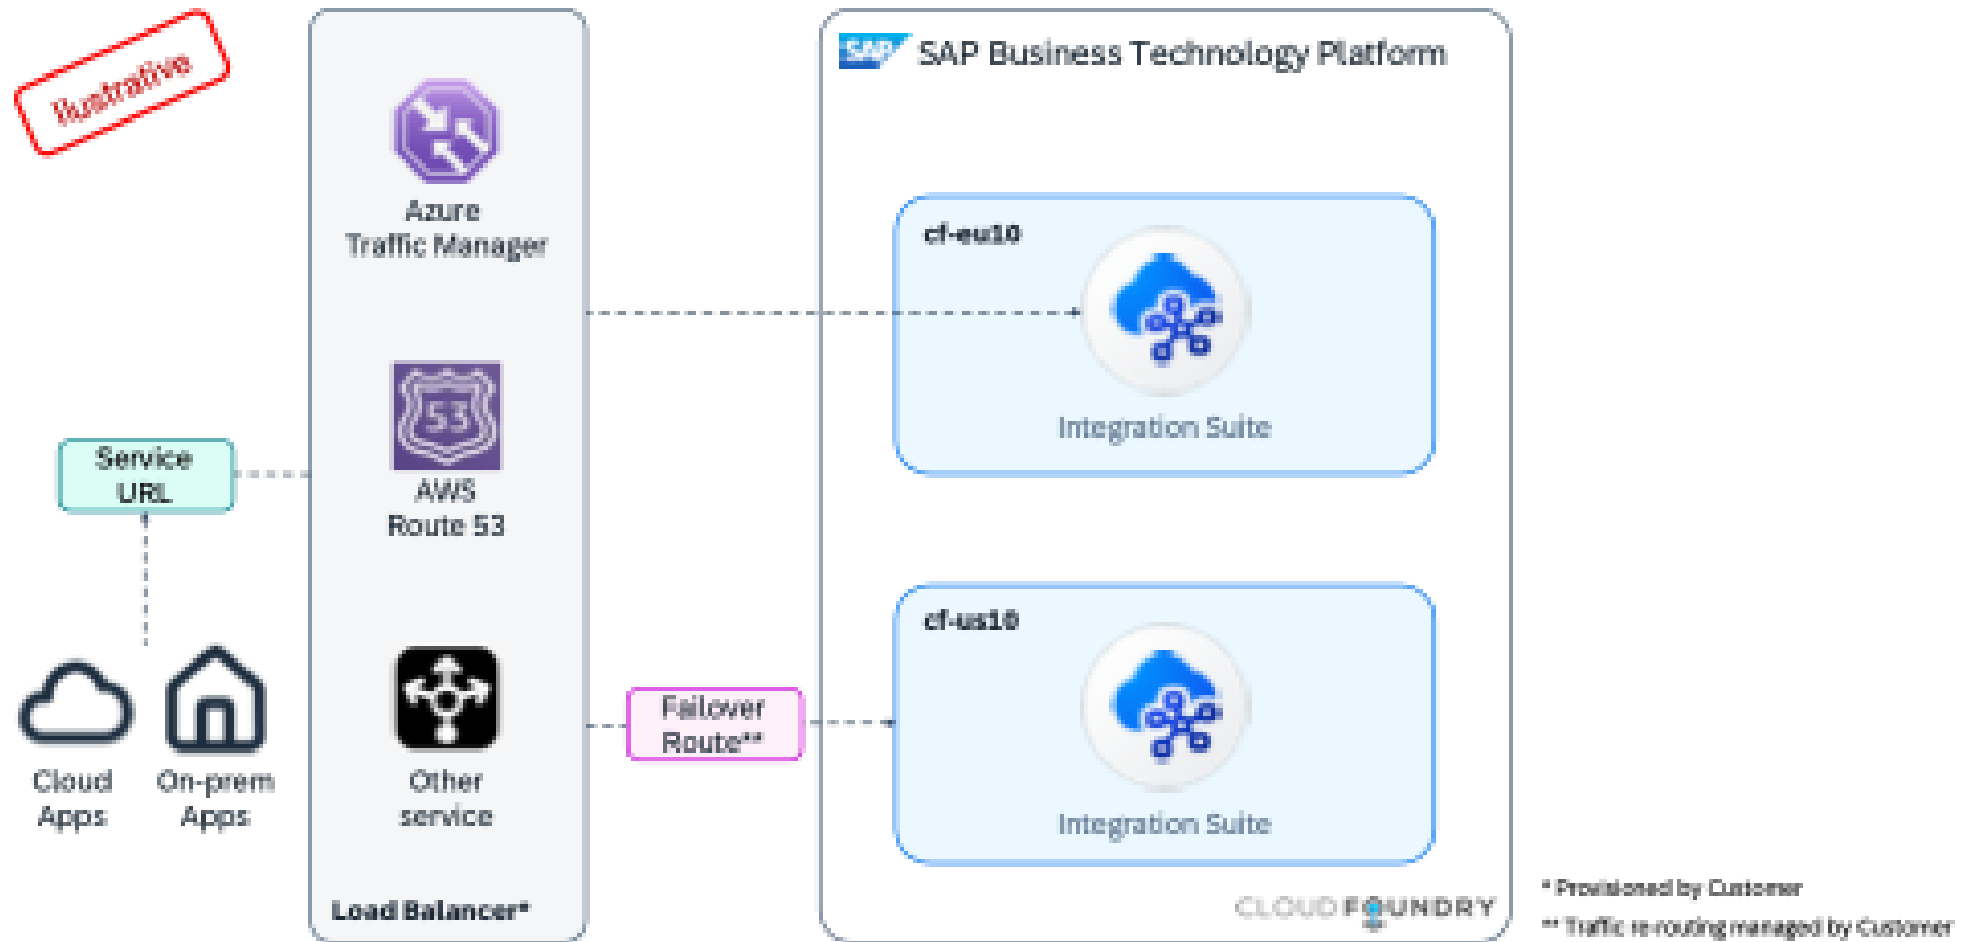

Current geo-political issues are causing additional concerns for customers deployed in a certain region or geography-area

SAP Integration Suite provides a built-in HA architecture

Deployment is localized to a single region or single cloud data-center

Disaster-Recovery Architecture Setup

2 or more tenants split across multi-region across different geographical locations providing availability and resiliency

Are there other options?

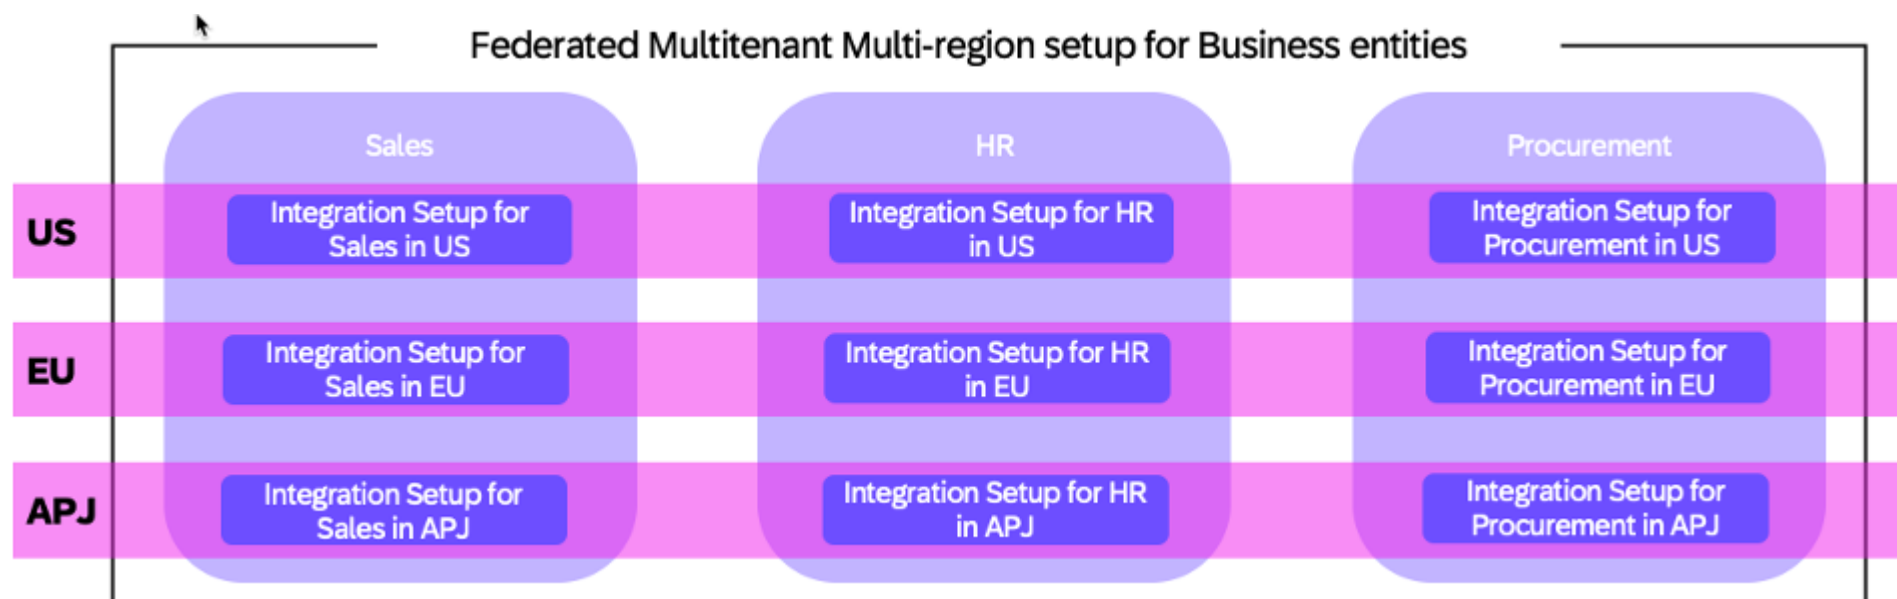

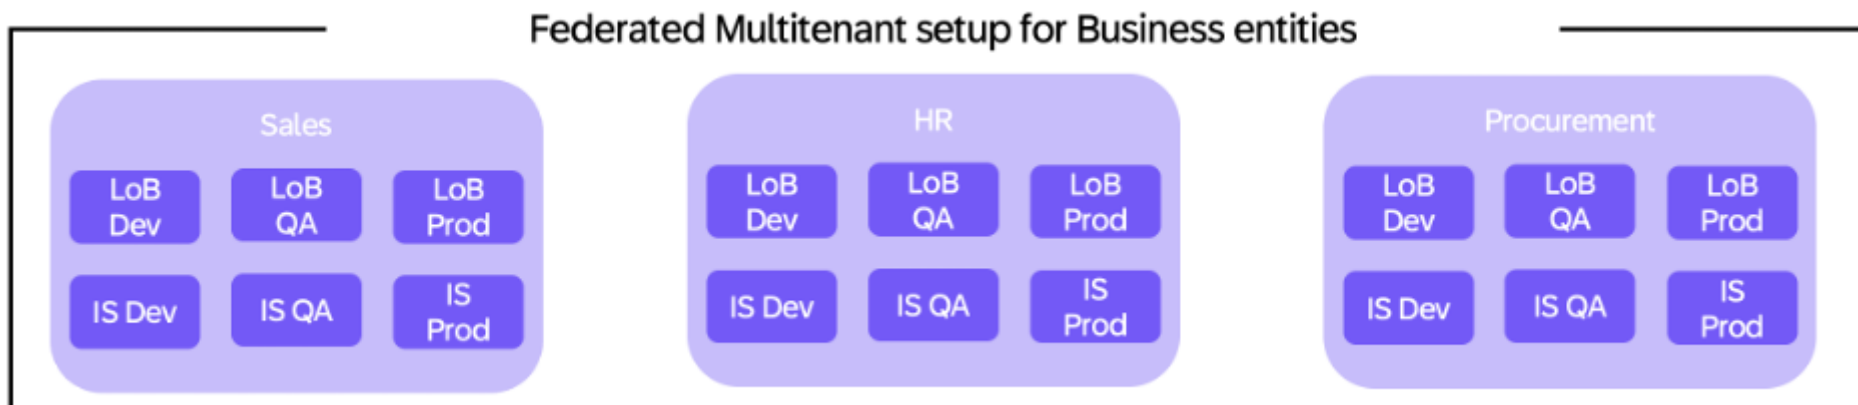

Significance of the Enterprise Middleware Integration Platform

As customer landscape environment grows, the enterprise middleware integration platform becomes more critical.

Identify strategies to split the message processing workloads

1. Across Critical and Non-critical message iFlows
2. Across different Business Units, LoB Divisions – like Sales, Marketing, Finance
3. Different geographical locations for local compliance and regulations like GDPR

Deployment Strategies

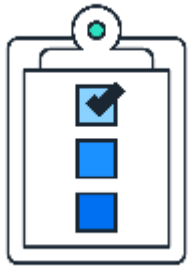

Introducing SAP Integration Suite, enhanced edition

INTERNAL – SAP and Partners Only

Enhanced Edition Summary

Enterprise-wide package supporting all integration patterns

Single tenant pricing
BTPEA, CPEA, PayGo &
Subscription availability
Upgrade option for Standard
edition customers

Future-ready with access to
Integration AI features and
innovations via AI units* –
improving productivity and
performance

Future-ready business process
orchestration with Advanced
Event Mesh 100 tenant and
Document AI features

* [Initially offered under Fair Use policy. Additional AI Unit charges are anticipated to take effect in late Q2 2026](#)

Integration Suite AI Features Available Now*

iFlow Generation*

Creation of integration flows by describing them in natural language

Script Optimization*

Helps developers analyze, refactor, and optimize scripts used inside Cloud Integration

Faster Development

API Anomaly Detection*

Observability and monitoring capabilities that detect unusual behavior in message processing

API Traffic Prediction*

Design and governance capabilities within API Management that assists developers in discovering, designing, and optimizing API performance

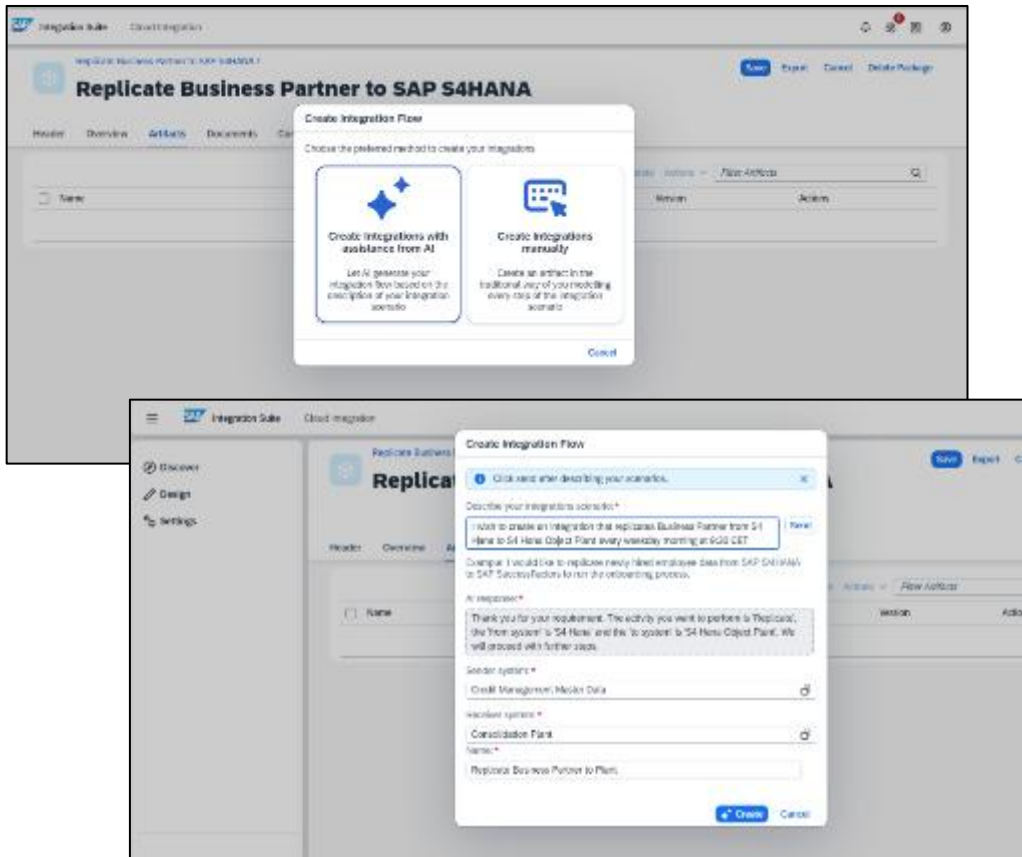

Improved Operations

* [Initially offered under Fair Use policy. Additional AI Unit charges are anticipated to take effect in late Q2 2026](#)

Generation of integrations*

Leveraging GenAI and unified customer landscape

 Integration developer

Challenge

- Customers face complex integration challenges with the diverse applications and systems in their landscape.
- Integrators must have the right domain & technical expertise, and invest a lot of time and effort to design new integrations & APIs.

Solution

- Based on the specific integration scenarios, different connecting applications and business partners, generate integration flows.
- Leveraging UCL to discover the customer landscape and offer seamless integrations between those systems
- Pre-configured connectors and scheduler

Outcome

Faster
time to design

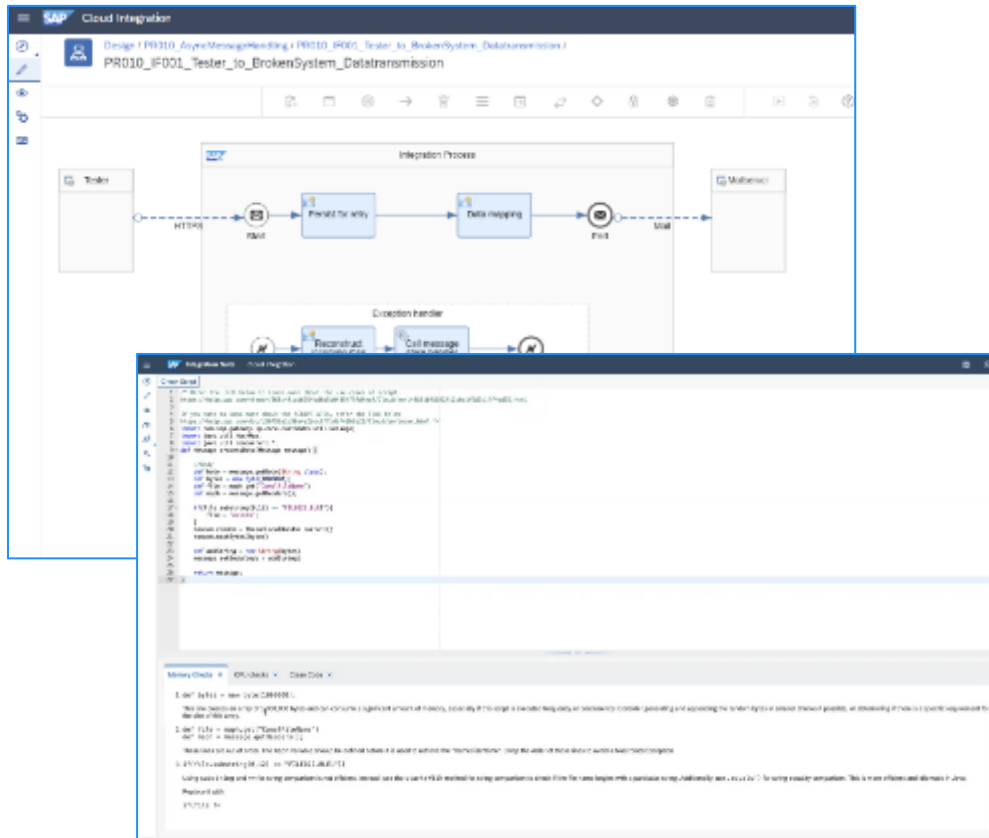

Cost savings
with reduced effort to implement

Script Optimization*

Leveraging GenAI to propose optimization in scripts

Integration Developer

Challenge

- Customers use complex custom coding in their integrations to resolve integration challenges
- Flawed design practices in these integration flows can result in low enterprise readiness of the customer's integration designs
- Scripting is a widely adopted powerful feature to build custom integrations

Solution

- Identification of integration design flaws in scripts
- AI-powered optimization of scripts with tailored proposals
- Insights into impact of integration flow design in production usage

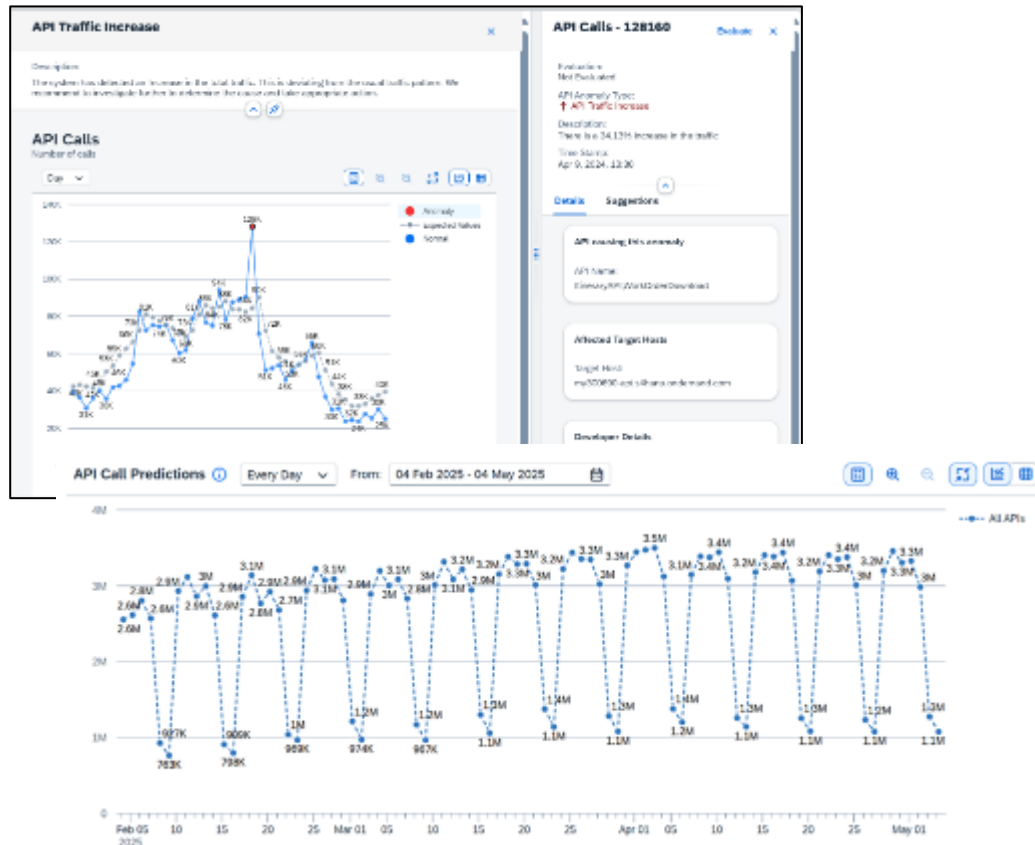

Outcome

- Higher uptime SLA for customer business processes
- Improved developer productivity and lower customer cost footprint
- Internal: support efficiency, optimized infrastructure resource usage

API anomaly detection and API traffic prediction*

Leveraging AI & machine learning to detect anomalies

 API owner

Challenge

- Deviations from the normal usage or performance in the API traffic indicates security threats, system malfunctions or other issues that hinder developer & user experience.

Solution

- ML based Anomaly detection identifies unusual or abnormal behaviors by continuously monitoring the API traffic.
- Notification to API Owners upon detection of anomalies in API Call Volume, API Error count, API Response time
- Provide insights to aid investigate the cause & analyze impact.
- Recommend suggestions on probable remedial actions
- Identify trends in API calls and predict future API traffic

Outcome

- Empowers organizations to maintain security, reliability & performance of their APIs
- Enables organizations to deliver better services & experience and hence achieve their business goals

Integration Suite Enhanced Edition Features Available Now!

Document AI*

SAP Document AI transforms unstructured documents into structured data, while the Integration Suite connects and automates that data across business systems, together delivering intelligent, touchless document processing

Example use case: iflow can be built for receiving and processing thousands of supplier invoices in mixed formats

AEM 100 Dev Tenant**

Drives faster EDA adoption and customer maturity, turning “event-driven” from a roadmap aspiration into an immediately usable capability

Example use case: real-time order fulfillment leveraging asynchronous event-streaming (order created, payment authorized, order packed, shipment dispatched, delivery confirmed)

Alert Notification Service*

Centralized event and alerting engine within SAP BTP that Integration Suite uses to proactively inform users about system events, anomalies, or errors across iFlows, APIs, and adapters

Quick Identification

Identify problems when they are cheapest to fix, before major problems are recognized

Be Proactive

Be alerted to events within your organization so you can act on them

Transport Management Service*

Allows customers to move integration artifacts and configurations across BTP subaccounts and landscapes without direct system access or manual export/import

Centralize services to subsidiaries

Reduce costs with automated deployment

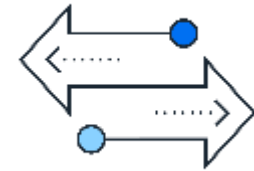

SAP Integration Suite, advanced event mesh 100 tenant*

The 100 tenant gives customers the opportunity to explore all that EDA can bring to their organization.:

Adopt an event-driven architecture (EDA) to enable real-time and resilient business processes that scale across ecosystems and geographies.

Asynchronous communication

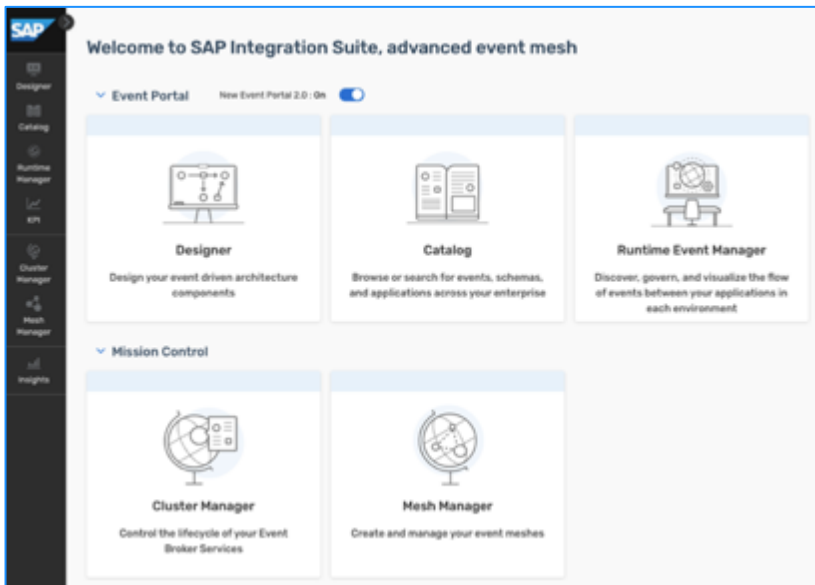

Instant responsiveness

Scalability and fault tolerance

SAP Integration Suite, advanced event mesh 100 tenant

Fully managed cloud service

✓

Infrastructure model

Maximum 100 connections, 8MB/S throughput, 2 cores

Deployment options

Private and public clouds

Connecting SAP and third-party systems

✓

Native support for SAP S/4HANA

✓

Support of standard protocols

✓

Message size and storage

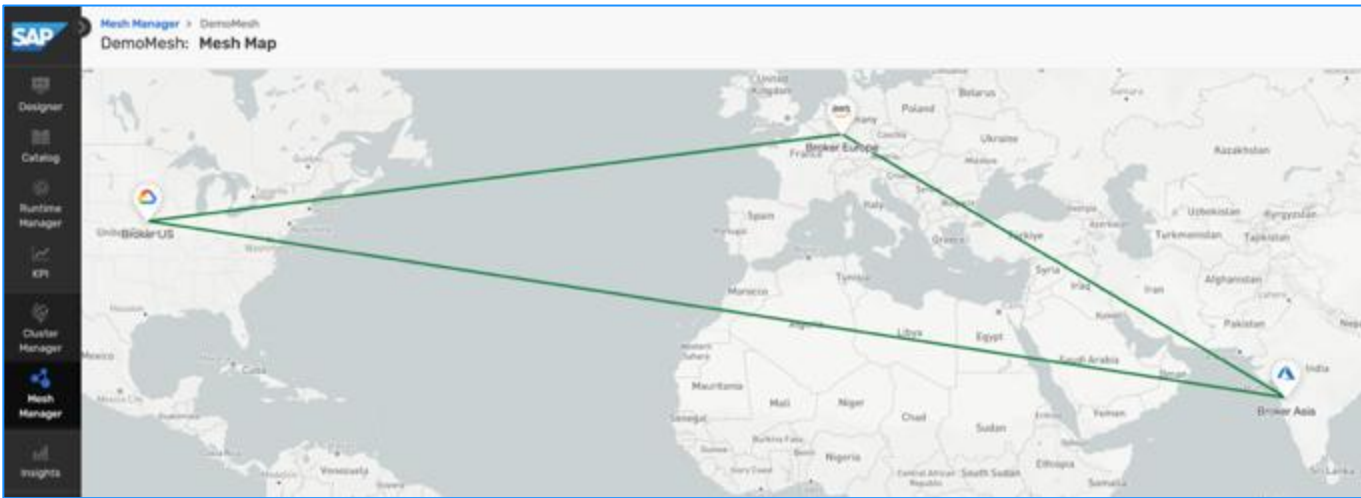

Up to 10MB / Up to 2GB

Typical use case size

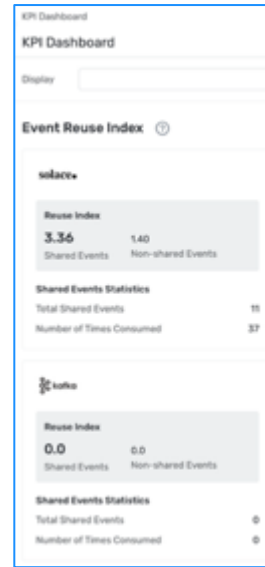

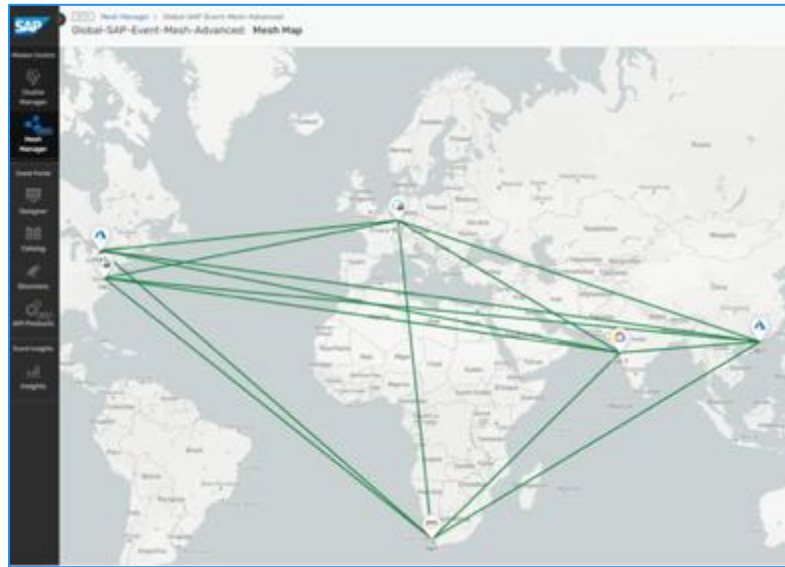

Small

Network of event brokers

✓

SAP Integration Suite, advanced event mesh: Sophisticated Features

Replay

Summary **Settings** Messages Logged Subscriptions

Incoming ☒

Partitioned queues ✓

Future Investment Areas for SAP Integration Suite – Enhanced Edition

Artificial Intelligence

- MCP for agentic AI (Q2'26)
- Joule-based conversational analytics for APIs (Q2'26)
- AI-assisted API specification and documentation generation (Q2'26)
- Migration agent for adapter modules, Java mappings (Q3'26)
- Joule-based generation of integration flows (Q3'26)
- Joule-based error interpreter in B2B monitoring (Q4'26)
